Numbers and Databases

Numbers of base pairs

The human genome is made of ~**3.2 billions bp** of DNA.
~6.4 billions of nucleotides [4].

Numbers and Databases

Numbers of base pairs

The human genome is made of ~**3.2 billions bp** of DNA.
~6.4 billions of nucleotides [4].

The HIV-1 genome is made of ~**20k bp** of DNA.
Meanwhile, the COVID-19 is made of ~**32k bp** [5].

Numbers and Databases

Numbers of base pairs

The human genome is made of ~**3.2 billions bp** of DNA.
~6.4 billions of nucleotides [4].

The HIV-1 genome is made of ~**20k bp** of DNA.
Meanwhile, the COVID-19 is made of ~**32k bp** [5].

There are approximately **19000** to **25000** genes.
No one knows for sure [4].

Numbers and Databases

Numbers of genes

There are approximately **19000** to **25000** genes.
No one knows for sure [4].

Numbers and Databases

Percentage of protein-coding genes

Only ~**1 per cent** of the human genome correspond to protein-coding genes. [4].

Human genes have dozens of introns, each of which can be tens of thousands of nucleotides. Distinguishing exons from introns and other forms of non-coding DNA is challenging [4].

Numbers and Databases

Databases

Database	Description
GenBank	Genetic sequence database
BLAST	Finds regions of similarity between sequences
ViPR	Viral genomes database
TCGA	The Cancer Genome Atlas
ICGC	International Cancer Genome Consortium

Numbers and Databases

Databases types

Primary	Secondary
GenBank	RefSeq
UniProt	Genes
PubMed	Taxon
PMC	OMIM
Intact	ICGC

Numbers and Databases

Cloud computing and new software paradigm

- Data sets are in Petabyte and soon Exabyte scale.
- Data (and the security rules that come with it) will be somewhere (not in our own data centre), and you will move your software to it.

Numbers and Databases

Cloud computing and new software paradigm

- FASTA, FASTAQ.
- EMBL.
- GCG.
- GenBank.

FASTA format

Figure: FASTA format example

Numbers and Databases

EMBL format

```

ID      AB000263 standard; RNA; PRI; 368 BP.

Figure: EMBL format example

Numbers and Databases

A2M format

The **A2M format** is used as the primary format for multiple alignments of protein or nucleic-acid sequences. For proteins, the legal alphabet is:

- ACDEFGHIKLMNPQRSTVWY for amino acids
- X for any amino acid
- B for N or D
- Z for Q or E
- O for creating a free-insertion module (FIM)

For nucleic acids, the legal alphabet in SAM is:

- ACGTU for nucleotides (with T and U considered equivalent)
- Y for C or T
- R for A or G
- N for any nucleotide
- O for creating a free-insertion module (FIM)
